

Assignment 3

Name : Prathmesh Marathe

PRN : 123B1B186

Div : C

Assignment Title : Design a Dynamic Web Application for an E-Commerce / Fashion Store using HTML, CSS, and JavaScript (using Bootstrap CDN).

Objectives :

- To understand the structure of a dynamic web application
- To design an e-commerce / fashion store interface
- To use HTML for page structure and content layout
- To apply CSS for styling and responsive design
- To implement JavaScript for dynamic functionality
- To use Bootstrap CDN for faster UI development

Outcomes :

- Design a dynamic e-commerce web application
- Implement client-side logic using JavaScript
- Use browser storage (localStorage) for cart and user data
- Create reusable UI components such as navbar and footer
- Filter products dynamically based on categories
- Build a functional shopping cart system

Theory :

A **dynamic web application** is a website that responds to user interactions in real time without reloading the entire page. Unlike static websites, dynamic applications use **JavaScript** to manipulate the Document Object Model (DOM), fetch data, and update content dynamically.

In an **e-commerce web application**, common features include:

- Product listing and filtering
- User registration and login

- Shopping cart management
- Dynamic price calculation
- Responsive UI

HTML is used to structure the content, **CSS** is used for styling and layout, while **JavaScript** adds interactivity such as product rendering, cart management, and form validation. **Bootstrap CDN** is used to ensure responsiveness and consistent design across devices.

Dataset Used :

- **Dataset Name:** E-Commerce Products Image Dataset
- **Source:** Kaggle (<https://www.kaggle.com/datasets/sunnykusawa/ecommerce-products-image-dataset>)
- **About the Dataset**
Contains real-world product images of:
 - Sofas
 - Jeans
 - T-Shirts

Conclusion :

In this assignment, we successfully designed and implemented a **dynamic e-commerce web application** using HTML, CSS, JavaScript, and Bootstrap CDN. The application demonstrates real-world features such as product filtering, cart management, user authentication, and responsive UI design. By using JavaScript and browser localStorage, the application provides interactive functionality without requiring a backend server. Integrating a real-world dataset enhanced the realism of the project. This assignment helped strengthen our understanding of **front-end development**, **DOM manipulation**, and **dynamic web application design**.
